

List of Known Bugs

☐ Flow Timer

- ☐ Timer won't start if input time is set to 0.

☐ TaskBites

- ☐ Attempting to add a task with either an empty description, or an empty/invalid date will result in a render error.
- ☐ Adding a negative date can result in "FirebaseError: Timestamp seconds out of range:" error.
- ☐ Adding an overly large date can result in "FirebaseError: Timestamp seconds out of range:" error.
- ☐ While having the task editing menu UI open, attempting to add another task will have the parameters auto-filled to that of the task being edited.

☐ Productivity Scope: Reflections

- ☐ Repeatedly attempting to enter a reflection with invalid parameters (empty parameters, or parameters with only spaces) can result in an uncaught error, no crash. "TypeError: Cannot read property 'value' of undefined, js engine: hermes"
- ☐ Once an error occurs, it becomes impossible to add valid reflections, the same error message as above.

☐ Settings

- ☐ Alert about camera roll settings despite having settings enabled.

☐ Account

- ☐ Old accounts run into errors, with what we assume to be firebase integration issues. TODO: Delete all older accounts before this date.

- ☐ Manually deleting an account while a user is logged in could potentially result in the account being recreated. May be a problematic security issue.
